Abstract

Contents

1 Preliminaries

Definition 1.1 (**subgraph**). *Let G_1 and G_2 be graphs. The graph G_2 is called a* subgraph *of G_1 if an injective morphism $f : G_2 \to G_1$ exists. We use the notation $G_2 \subseteq G_1$ if G_2 is a subgraph of G_1 and $G_2 \subset G_1$ if f is not bijective.*

Definition 1.2 (**minimal uppergraph**). *Let G_1 and G_2 be graphs with $G_1 \subseteq G_2$. A graph C is called an* minimal uppergraph *of G_1 w.r.t G_2, if $G_1 \subset C \subseteq G_2$ and no graph $C' \subset C$ with $G_1 \subset C \subseteq G_2$ exists. The set of minimal uppergraphs of G_1 w.r.t. G_2 is denoted by $\mathcal{U}(G_1, G_2)$. If $G_1 = G_2$, we set $\mathcal{U}(G_1, G_2) = \{G_1\}$.*

Definition 1.3 (**overlap**). *Let G and G' be graphs. A graph H is called an* overlap *of G and G' if morphisms $p : G \hookrightarrow H$ and $p' : G' \hookrightarrow H$ such that p and p' are jointly surjective. The set of all overlaps of G and G' is denoted by $\mathrm{ol}(G, G')$.*

Definition 1.4 (**overlap at morphism**). *Let C,G and C' with $C \subset C'$ be graphs and $p : C \hookrightarrow G$ a morphism. A graph H is called an* overlap of G and C' at p *if a morphism $p' : C' \hookrightarrow H$ with $p'|_C = p$ exists. The set of all overlaps of G and C' at p is denoted by $\mathrm{ol}_p(G, C')$.*

Definition 1.5 (**partial morphism**). *Let $f : G_1 \to G_2$ and $g : G_3 \to G_4$ be morphisms. The morphism g is called a* partial morphism *of f if $G_3 \subseteq G_1$, $G_4 \subseteq G_2$ and $f|_{G_3} = g$.*

Definition 1.6 (**nested graph condition**). *A* graph condition *over a graph C_0 is inductively defined as follows:*

- *$true$ is a graph condition over every graph.*

- *$\exists(a : C_0 \hookrightarrow C_1, d)$ is a graph condition over C_0 if a is a injective graph morphism and d is a graph condition over C_1.*

- *$\neg d$ is a graph condition over C_0 if d is a graph condition over C_0.*

- *$d_1 \wedge d_2$ and $d_1 \vee d_2$ are graph conditions over C_0 if d_1 and d_2 are graph conditions over C_0.*

Conditions over the empty graph $\emptyset$ are called constraints. *Every injective morphism $p : C_0 \hookrightarrow G$ satisfies $true$. An injective morphism p satisfies $\exists(a : C_0 \hookrightarrow C_1, d)$ if there exists an injective morphism $q : C_1 \hookrightarrow G$ such that $q \circ a = p$ and q satisfies c. An injective morphism satisfies $\neg d$ if it does not satisfy d, it satisfies $d_1 \wedge d_2$ if it satisfies d_1 and d_2 and it satisfies $d_1 \wedge d_2$ if it satisfies d_1 or d_2. A graph G satisfies a constraint c, $G \models c$, if $p : \emptyset \hookrightarrow G$ satisfies c. We use the abbreviation $\forall(a : C_0 \hookrightarrow C_1, d) := \neg\exists(a : C_0 \hookrightarrow C_1, \neg d)$.*

The nesting level nl *of a condition is defined as $\mathrm{nl}(true = 0$ and $\mathrm{nl}(\exists(a : P \to Q, d)) := \mathrm{nl}(d) + 1$.*

Definition 1.7 (alternating quantifier normal form (ANF)[1]**).** *A graph condition* c *is in* alternating normal form *(ANF) if it is of the form*

$$c = Q(a_1 : C_0 \hookrightarrow C_1, \overline{Q}(a_2 : C_1 \hookrightarrow C_2, Q(a_3 : C_2 \hookrightarrow C_3, \overline{Q}(a_4 : C_3 \hookrightarrow C_4, \ldots))))$$

with $Q \in \{\exists, \forall\}$ *and* $\overline{Q} = \exists$ *if* $Q = \forall$, $\overline{Q} = \forall$ *if* $Q = \exists$.

2 partial consistency improving

2.1 extended alternating quantifier normal form

Definition 2.1 (extended alternating quantifier normal form). *A condition* c *is in* extended alternating quantifier normal form *(EANF) if it is in ANF, universally bound and ends with a condition of the form* $\exists(a_k : C_k \hookrightarrow C_{k+1}, e)$ *with* $e \in \{$true, false$\}$.

Lemma 2.2. *Any constraint in ANF can be transformed into an equivalent constraint in EANF.*

Proof. Let c be a constraint in ANF. If c is universally bound and ends with a condition of the form $\exists(a_k : C_k \hookrightarrow C_{k+1}, e)$ with $e \in \{$true, false$\}$, c is already in EANF. We construct the equivalent constraint in EANF by two steps and show that, after each step, the derived constraint is equivalent to c.

1. If $c = \exists(a_1 : \emptyset \hookrightarrow C_0, e)$ is existentially bound, we show that c is equivalent to $d := \forall(a_0 : \emptyset \hookrightarrow \emptyset, c)$. Let G be a graph.

   "$\Longrightarrow$": Let $p : \emptyset \hookrightarrow G$ be a morphism with $p \models c$, therefore a morphism $q : C_0 \to G$ with $q \models e$ and $p = q \circ a_0$ exists. Then, $p \models d$, since p is the only morphism from $\emptyset$ to G and $p = p \circ a_1$ and $p \models c$.

   "$\Longleftarrow$": Let $p : \emptyset \hookrightarrow G$ be a morphism with $p \models d$, therefore all morphisms $q : \emptyset \hookrightarrow G$ with $p = q \circ a_0$ satisfy c. With $p = p \circ a_0$, $p \models c$ follows immediately.

2. If c ends with a condition of the form $d = \forall(a_k : C_k \hookrightarrow C_{k+1}, e)$ with $e \in \{$true, false$\}$. We show that d is equivalent to $d' = \forall(a_k : C_k \hookrightarrow C_{k+1}, \exists(a_{k+1} : C_{k+1} \hookrightarrow C_{k+1}, e))$. Let G be a graph.

   (a) If $e = $ true. Let $p : C_k \hookrightarrow G$ be a morphism, we show that $p \models d$ and $p \models d'$. Since every morphism satisfies true, a morphism $q : C_k \hookrightarrow G$ with $p = a_k \circ q$ and $p \not\models e$ cannot exist, therefore $p \models d$. The morphism a_{k+1} has to be the identity on C_{k+1} and therefore for every $q : C_k \hookrightarrow G$ with $p = a_k \circ q$ is holds that $q = a_{k+1} \circ q$ and $q \models e$. It follows that $p \models d'$.

   (b) If $e = $ false:

   "$\Longrightarrow$": Let $p : C_k \hookrightarrow G$ be a morphism with $p \models d$. Since $e = $ false, no morphism $q : C_{k+1} \hookrightarrow G$ with $p = a_k \circ q$ exists. Therefore, no morphism $q : C_{k+1} \hookrightarrow G$ with $p = a_k \circ q$ and $q \not\models \exists(a_{k+1} : C_{k+1} \hookrightarrow C_{k+1}, e)$ exists. It follows, that $p \models d'$.

"$\Longleftarrow$": Let $p : C_k \hookrightarrow G$ be a morphism with $p \models d'$. Since no morphism satisfies false, no morphism $q : C_{k+1} \hookrightarrow G$ satisfies $\exists(a_{k+1} : C_{k+1} \hookrightarrow C_{k+1}, e)$. Hence, there does not exist a morphism $q : C_{k+1} \hookrightarrow G$ with $p = q \circ a_k$ and $p \models d$ follows.

$\square$

2.2 conditions up to layer

Definition 2.3 (**Layer of a subcondition**). *Let c be a condition and d a subcondition of c. The layer of d is defined as $\mathrm{lay}(d) := \mathrm{nl}(c) - \mathrm{nl}(d) - 1$.*

Definition 2.4 (**substitution at layer**). *Let $c = Q(a : C_0 \hookrightarrow C_1, d)$ be a condition in ANF, such that the subcondition of c with layer $0 \le k \le \mathrm{nl}(c)$ is a condition over C_k. Let e be a condition over C_k. The substitution in c at layer k with e, $\mathrm{sub}(k, c, e)$, is recursively defined as:*

1. *If $k = 0$:*
$$\mathrm{sub}(0, c, e) := e$$

2. *If $k > 0$:*
$$\mathrm{sub}(k, c, e) := Q\big(a : C_0 \hookrightarrow C_1, \mathrm{sub}(k - 1, d, e)\big)$$

Definition 2.5 (**Condition up to layer**). *Let c be a condition in ANF and d be the subcondition of c at layer $0 \le k \le \mathrm{nl}(c)$. The condition up to layer k of c, $\mathrm{cond}(k, c)$, is defined as*

$$\mathrm{cond}(k, c) := \begin{cases} \mathrm{sub}(k, c, \textsf{true}) & \text{, if } k = 0 \lor d \text{ is existentially bound} \\ \mathrm{sub}(k, c, \textsf{false}) & \text{, if } d \text{ is universally bound.} \end{cases}$$

Definition 2.6 (**Satisfaction up to layer**). *Let G be a graph and c be a condition over C_0. A morphism $p : C_0 \hookrightarrow G$ satisfies c up to layer k, $p \models_k c$, if*

$$p \models \mathrm{cond}(k, c).$$

A graph G satisfies a constraint c up to layer k, $G \models_k c$, if $q : \emptyset \hookrightarrow G$ satisfies $\mathrm{cond}(k, c)$. The biggest k with $G \models_k c$ such that no $j > k$ with $G \models_j c$ exists is denoted by $c_{\max}$.

Lemma 2.7. *Let G be a graph $p : C_0 \hookrightarrow G$ a morphism and c a condition over C_0 in ANF with $p \models_k c$. If the subcondition $d = Q(a_k : C_{k-1} \hookrightarrow C_k, e)$ of c at layer k is universally bound, then for any condition f over C_k it holds that*

$$p \models \mathrm{sub}(k, c, f).$$

5

Proof. Let k be the smallest number such that $p \models_k c$ and the subcondition of c with layer k is universally bound, let $d = \forall(a_k : C_{k-1} \hookrightarrow C_k, e)$ be this subcondition. Let $q : G_{k-1} \to G$ be a morphism such that $q \models \forall(a_k : C_{k-1} \hookrightarrow C_k, \mathsf{false})$. This must exist, since $p \models_k c$ and k is the smallest number such that $p \models_k v$ and the subcondition of c with layer k is universally bound.

Therefore, there does not exist a morphism $q' : C_k \to G$ with $q = q' \circ a_k$. Hence, for every condition f over C_k a morphism $q' : C_k \to G$ with $q \not\models f$ and $q = q' \circ a_k$ cannot exist. It follows immediately that $q \models \forall(a_k : C_{k-1} \hookrightarrow C_k, f)$. $\qquad \square$

Lemma 2.8. *Let G be a graph, $p : C_0 \to G$ a morphism and c a condition over C_0 in ANF with $p \models_k c$. If the subcondition d of c with $\mathrm{lay}(d) = k$ is universally bound,*

$$p \models_k c \implies p \models c.$$

Proof. Follows immediately by using lemma 2.7 and setting f to the subcondition of c with layer $k + 1$. $\qquad \square$

Lemma 2.9. *Let c be a condition in ANF over C_0 and $p : C_0 \hookrightarrow G$ a morphism with $p \models_k c$. Let $d = Q(a_{k+2} : C_{k+1} \hookrightarrow C_{k+2}, e)$ be the subcondition of c with layer $k + 2$. There does exist a graph $C_{k+1} \subseteq C' \subseteq C_{k+2}$ such that*

$$p \models \mathrm{sub}\big(k + 1, c, Q(a_{k+2} : C_{k+1} \hookrightarrow C', f)\big)$$

with f being a $\overline{Q}$ bound condition over C'.

Proof. If $p \models c$, we can choose $C' = C_{k+2}$ and $f = e$.

If $p \not\models c$, there does not exists a j with $p \models_j c$ and the subcondition of c with layer j is universally bound and $Q = \exists$ follows immediately. We choose $C' = C_{k+1}$ and $f = \mathsf{true}$. Let $q : C_k \to G$ with $p = q \circ a_k \circ \ldots \circ a_1$ and $q \circ \ldots \circ a_\ell$ satisfying the condition up to $\ell - k$ of the subcondition of c at layer ℓ for all $0 \le \ell \le k$. This morphism must exists since $p \models_k c$ and $p \not\models c$. Let $q' : C_{k+1} \to G$ be a morphism with $q = q' \circ a_{k+1}$. Since $C' = C_{k+1}$, the morphism a'_{k+2} has to be the identity and therefore $q' = q' \circ a'_{k+2}$. It follows that $q' \models \exists(a'_{k+2} : C_{k+1} \hookrightarrow C', \mathsf{true})$ and therefore $p \models \mathrm{sub}\big(k + 1, c, Q(a_{k+2} : C_{k+1} \hookrightarrow C', f)\big)$. $\qquad \square$

Definition 2.10 (**partial condition**)**.** *Let c be a condition in ANF over C_0. Let d be the subcondition of c at layer $k + 1$. The* partial condition *of c at layer k with C', $\mathrm{part}(k, c, C')$ is defined as:*

1. *If d is universally bound, let $e = \exists(a : C_{k+1} \hookrightarrow C_{k+2}, f)$ be the subcondition of c at layer $k + 2$ with $C_{k+1} \subseteq C' \subseteq C_{k+2}$:*

$$\mathrm{part}(k, c, C') := \mathrm{sub}\big(k + 2, c, \exists(a : C_{k+1} \hookrightarrow C', \mathit{true})\big)$$

2. *If $d = \exists(a : C_k \hookrightarrow C_{k+1}, f)$ is existentially bound with $C_k \subseteq C' \subseteq C_{k+1}$:*

$$\mathrm{part}(k, c, C') := \mathrm{sub}\big(k + 1, c, \exists(a : C_{k+1} \hookrightarrow C', \mathit{true})\big)$$

Definition 2.11 (**biggest partially satisfying condition**). *Let G be a graph, c a condition over C_0 and $p : C_0 \hookrightarrow G$ a morphism with $p \models_k c$.*

A partial condition $c = \mathrm{part}(c_{\max}, c, C')$ with $p \models c$ is a biggest partially satisfying condition if there does not exist a graph $C' \subset C''$ with $p \models \mathrm{part}(c_{max}, c, C'')$. The graph C' is called a biggest partially satisfying graph.

The set of biggest partially satisfying conditions of c is denoted by $\mathcal{P}_c^G$.

The set of all biggest partially satisfying graphs is denoted by $\mathcal{G}_c^G$.

2.3   minimal consistency improving

Definition 2.12 (**number of violations**). *Let G be a graph and c a constraint in EANF. The number of violations $\mathrm{nvc}(j, G)$ at layer j in G is defined as:*

1. *If $j < c_{\max}$:*
$$\mathrm{nvc}(j, G) := 0$$

2. *If $j = c_{\max}$, let $d = \forall(a_k : C_j \hookrightarrow C_{j+1}, e)$ be the subcondition of c at layer $j + 1$.*

$$\mathrm{nvc}(j, G) := \sum_{C \in \mathcal{G}_c} \sum_{C' \in \mathcal{U}(C, C_{j+1})} |\{q \mid q : C_{j+1} \hookrightarrow G \wedge q \not\models \mathrm{part}(1, e, C')\}|$$

3. *If $j > c_{\max}$:*
$$\mathrm{nvc}(j, G) := \infty$$

Definition 2.13 (**minimal consistency improving**). *Let a graph G, a rule r and a constraint c in ANF be given.*

A transformation $G \Longrightarrow_{r,m} H$ is called minimal consistency improving, if

$$\mathrm{nvc}(k, H) < \mathrm{nvc}(k, G)$$

for any $0 \le k \le \mathrm{nl}(c)$. A rule r is called minimal consistency improving, if all of its applications to graphs G with $G \not\models c$ are.

Lemma 2.14. *Let a graph G, a morphism $p : C_0 \to G$ and a constraint c in ANF over C_0 with $p \models_k c$ be given. Then, $p \models_j c$ for all $j < k$ such that the subcondition of c at layer j is existentially bound.*

Proof.   1. The subcondition of c at layer k is existentially bound: If an $j < k$ with $p \models_j c$ exists such that the subcondition of c at layer j is universally bound, let j_1 be the smallest of these. With lemma 2.7 follows that $p \models_{j_2} c$ for all $j_1 < j_2$. Let $\ell < j_1$, such that the subcondition of c at layer ℓ is existentially bound and let $d = \exists(a_\ell : C_\ell \hookrightarrow C_{\ell+1}, e)$ be the condition up to layer $j_1 - \ell$ of the subcondition of c at layer ℓ. Since $\ell < j_1$, a morphism $q : C_\ell \to G$ with $q \models d$ must exists and therefore a morphism $q' : C_{\ell+1} \to G$ with $q = q' \circ a_k$ must exists. If follows that $q \models \exists(a_\ell : C_\ell \hookrightarrow C_{\ell+1}, \mathsf{true})$ and with that $p \models_\ell c$.

7

2. The subcondition of c at layer k is universally bound: With lemma 2.7 follows that $p \models_{k+1} c$. Since c is in ANF, 1. can be applied to $k+1$.

$\square$

Theorem 2.1. *Let a graph G, a rule r and a constraint c in ANF be given. Let $k < \mathrm{nl}(c)$ be the biggest number, such that $G \models_k c$. A transformation $G \Longrightarrow_{r,m} H$ is minimal consistency improving if $G \models_j c$ and $k < j$.*

Proof. No $\ell > k$ with $G \models_\ell c$ exists and $G \models_k c$. Hence, $\mathrm{nvc}(k,G) > 0$ and $\mathrm{nvc}(k,G) \neq \infty$. Since $j > k$, $\mathrm{nvc}(k,H) = 0$ and it follows immediately that the transformation is minimal consistency improving. $\square$

Definition 2.15 (**direct minimal consistency improving**)**.** *Let G be a graph, r a plain rule and c a constraint in EANF. Let $d = \forall(a_k : C_{k-1} \hookrightarrow C_k, e)$ be the condition at layer k of c and*

$$\mathbf{G} := \bigcup_{C' \in \mathcal{G}_c^G} \mathcal{U}(C', C_{k+1})$$

be the set of all minimal upper-graphs of all biggest partially satisfying graphs. A transformation $t : G \Longrightarrow_{r,m} H$ is called direct minimal consistency improving *if $H \models_k c$ and equations (2.1), (2.2) and (2.3) hold.*

Every occurrence of C_k in G that satisfies $\mathrm{part}(1, d, C')$ for any $C' \in \mathbf{G}$ still satisfies $\mathrm{part}(1, d, C')$ in H.

$$\forall p : C_k \hookrightarrow G\Big(\bigwedge_{C' \in \mathbf{G}} \big(p \models \mathrm{part}(1,d,C') \wedge \mathrm{tr}_t \circ p \text{ is total}\big)$$
$$\implies \mathrm{tr}_t \circ p \models \mathrm{part}(1,d,C')\Big)$$

(2.1)

Every new inserted occurrence of C_k by t satisfies $\mathrm{part}(1, d, C')$ for all $C' \in \mathbf{G}$.

$$\forall p' : C_k \hookrightarrow H\Big(\neg \exists p : C_k \hookrightarrow G(p' = \mathrm{tr}_t \circ p) \implies \big(\bigwedge_{C' \in \mathbf{G}} p' \models \mathrm{part}(1,d,C')\big)\Big) \qquad (2.2)$$

At least one occurrence of C_k in G that does not satisfy $\mathrm{part}(1, d, C')$, for any $C' \in \mathbf{G}$, either has been destroyed by t or satisfies $\mathrm{part}(1, d, C')$ in H.

$$\exists p' : C_k \hookrightarrow G\Big(\mathrm{tr}_t \circ p \text{ is not total} \vee$$
$$\bigvee_{C' \in \mathbf{G}} \big(p \not\models \mathrm{part}(1,d,C')$$
$$\implies (\mathrm{tr}_t \circ p' \text{is total} \wedge \mathrm{tr}_t \circ p \models \mathrm{part}(1,d,C'))\big)\Big)$$

(2.3)

Lemma 2.16. *Let a graph G, a constraint c and a direct minimal improving transformation $t : G \Rightarrow_{r,m} H$ w.r.t. c be given. Then, t is also a minimal improving transformation.*

Proof. Let G be a graph with $k = \mathrm{c_{max}}$ and $G \models \mathrm{part}(k,c,C)$ with $\mathrm{part}(k,c,C) \in \mathcal{P}_c^G$. Let d be the subcondition of c at layer $k+1$.

1. We show that equations (2.1) and (2.2) imply that $\mathrm{nvc}(k, H) \leq \mathrm{nvc}(k, G)$. Assume that $\mathrm{nvc}(k, H) > \mathrm{nvc}(k, G)$. Therefore, a morphism $p : C_k \hookrightarrow G$ with $p \not\models \mathrm{part}(1, d, C')$ for any $C' \in \mathcal{U}(C, C_{k+1})$ exists, such that either 1a or 1b is satisfied.

   (a) There does exist a morphism $q' : C_k \hookrightarrow G$ with $q' \models \mathrm{part}(1, d, C')$ and $p = \mathrm{tr}_t \circ q'$.

   (b) There does not exist a morphism $q : C_k \hookrightarrow G$, such that $p = \mathrm{tr}_t \circ q$.

   This is a contradiction, if 1a is satisfied, q' does not satisfy equation (2.1) and if 1b is satisfied q does not satisfy equation (2.2).

2. Since (2.3) is satisfied, a morphism $p : C_k \hookrightarrow G$ with $p \not\models \mathrm{part}(1, d, C')$, such that either $\mathrm{tr} \circ p$ is total and $p \models \mathrm{part}(1, d, C')$ or $\mathrm{tr} \circ p$ is not total exists, for any $C' \in \mathbf{G}$. In both cases the following holds

$$p \in \{q \mid q : C_k \hookrightarrow G \wedge q \not\models \mathrm{part}(1, e, C')\} \wedge$$
$$\mathrm{tr} \circ p \notin \{q \mid q : C_{k+2} \hookrightarrow H \wedge q \not\models \mathrm{part}(1, e, C')\}.$$

   With that and 1 it follows that

$$|\{q \mid q : C_k \hookrightarrow G \wedge q \not\models \mathrm{part}(1, e, C')\}| < |\{q \mid q : C_{k+2} \hookrightarrow H \wedge q \not\models \mathrm{part}(1, e, C')\}|.$$

With 1 and 2 follows that $\mathrm{nvc}(k, G) < \mathrm{nvc}(k, G)$ and therefore t is a minimal improving transformation. $\square$

3 application condition

Definition 3.1 (extended overlap). *Let G and $C_0 \subseteq C_1$ be graphs. Let C be an overlap of C_0 and G with the overlap morphism: $q : C_0 \hookrightarrow C$.*

Let $p = L \hookleftarrow K \hookrightarrow R$ be a plain rule with $K = C_0$, $L = K$ and $R = C_1$. The graph H, derived by the transformation

$$C \Longrightarrow_{p,q} H$$

is called the extended overlap of C with C_1. *The extended overlap of an overlap C with an graph C_1 is denoted by $\mathrm{eol}(C, C_1)$.*

Lemma 3.2. *Let graphs G, $C_0 \subset C_1$ and an overlap C of G and C_0 be given. Then, $\mathrm{eol}(C, C_1)$ is an overlap of G and C_1 and $C \subset \mathrm{eol}(C, C_1)$.*

Proof. The graph $\mathrm{eol}(C, C_1)$ is constructed by the transformation $C \Longrightarrow_{p,q} \mathrm{eol}(C, C_1)$ with $p = C_0 \hookleftarrow C_0 \hookrightarrow C_1$. Since the comatch $n : C_1 \hookrightarrow \mathrm{eol}(C, C_1)$ exists, $\mathrm{eol}(C, C_1)$ is an overlap of G and C_1. Because $L = K$, the transformation does not delete any elements and $C \subset \mathrm{eol}(C, C_1)$ follows. $\square$

Definition 3.3 (overlap shift). *Let $r = L \hookleftarrow K \hookrightarrow R$ be a plain rule, C a graph and C' an overlap of C and L with morphisms $p : L \hookrightarrow C'$, $k : K \hookrightarrow C'$, $c : C \hookrightarrow C'$ and the partial morphism $q : R \hookrightarrow C'$. We define*

$$D := \{e \in C' \mid (\exists e' \in L : p(e') = e$$
$$\vee \exists e' \in R : q(e') = e) \tag{3.1}$$
$$\wedge \exists e' \in C : c(e') = e\}$$

Let $r = L \hookleftarrow K' \hookrightarrow R$ be the rule with

$$K' := K \cup D$$

The graph H derived by the transformation $G \Rightarrow_{r,p} H$ is called the overlap shifted graph *of C'. The overlap shifted graph of an graph C is denoted by $\mathrm{ols}(C)$.*

Definition 3.4. *Let $r = L \hookleftarrow K \hookrightarrow R$ be a plain rule and c a constraint in EANF. Let $d = \forall(a_k : C_{k-1} \hookrightarrow C_k, \exists(a_{k+1} : C_k \hookrightarrow C_{k+1}, e))$ be the subcondition of c at layer k with $k = 2i - 1$ for an $i \in \mathbb{N}$. The application condition ap_k of the condition at layer k of c with $C' \in \mathcal{U}(C_k, C_{k+1})$ is defined as:*

$$\mathrm{ap}(k, C') := \Big(\bigvee_{P \in \mathrm{ol}(L, C_k)} \mathrm{nex}(P, C') \wedge (\mathrm{rep}(P, C') \vee \mathrm{del}(P, C'))\Big) \wedge$$
$$\Big(\bigwedge_{P \in \mathrm{ol}(L, C_k)} \mathrm{ex}(P, C')\Big) \wedge \tag{3.2}$$
$$\Big(\bigwedge_{P \in \mathrm{ol}(R, C_k)} \mathrm{rem}(P, C')\Big)$$

with

1.

$$\mathrm{nex}(P, C') := \exists(a : L \hookrightarrow P, \neg\exists(b : P \hookrightarrow \mathrm{eol}(P, C'), \textit{true}))$$

2.

$$\mathrm{rep}(P, C') := \mathrm{Left}(\forall(a : R \hookrightarrow \mathrm{ols}(P), \exists(b : \mathrm{ols}(P) \hookrightarrow \mathrm{ols}(\mathrm{eol}(P, C')), \textit{true})), r)$$

3. *Let $i_1 : L \hookrightarrow P$ and $i_2 : C_k \hookrightarrow P$ be the overlap morphisms of P:*

$$\mathrm{del}(P, C) := \begin{cases} \exists(L \hookrightarrow P, \textit{true}) & \text{, if } i_1(L \setminus K) \cap i_2(C_k \setminus C_{k-1}) \neq \emptyset \\ \textit{false} & \text{, otherwise} \end{cases}$$

4. *Let $i' : L \hookrightarrow P$ and $i_j : C_j \hookrightarrow P$ be the inclusion morphisms for all $j \leq k$, let E be the set of all existentially bound graphs C_j with $j \leq k$:*

$$\mathrm{ex}(P, C) := \begin{cases} \neg\exists(L \hookrightarrow P, \textit{true}) & \text{, if } \bigcup_{C_j \in E}\big(i_j(C_j \setminus C_{j-1}) \cap i'(L \setminus K)\big) \neq \emptyset \\ \textit{true} & \text{, otherwise} \end{cases}$$

5. Let $i' : R \hookrightarrow P$ and $i_j : C_j \hookrightarrow P$ be the inclusion morphisms for all $j \leq k$, let U be the set of all universally bound graphs C_j with $j \leq k$:

$$\text{rem}(P,C) := \begin{cases} \text{Left}(\neg\exists(R \hookrightarrow P, \textit{true}), r) & \text{, if } \bigcup_{C_j \in U}\big(i_j(C_j \setminus C_{j-1}) \cap i'(R \setminus K)\big) \neq \emptyset \\ \textit{true} & \text{, otherwise} \end{cases}$$

Lemma 3.5. *Let G be a graph, c a constraint in EANF, with $G \not\models c$, and r a plain rule. Let $d = \forall(a_k : C_{k-1} \hookrightarrow C_k, \exists(b : C_k \hookrightarrow C_{k+1}, e)$ be the condition at layer $c_{\max}$ of c. Then, every application of $(r, \text{ap}(c_{\max}, C'))$ with*

$$C' \in \bigcap_{C \in \mathcal{G}_c^G} \mathcal{U}(C, C_{k+1})$$

is direct minimal consistency improving.

Proof. $\hfill\square$

Lemma 3.6. *Let G be a graph, c a constraint in ANF, such that $G \models_k c$, and $r = L \overset{l}{\hookleftarrow} K \overset{r}{\hookrightarrow} R$ a plain rule. Let $d = \forall(a_k : C_k \hookrightarrow C_{k+1}, \exists(b : C_{k+1} \hookrightarrow C_{k+2}, e)$ be the condition at layer k of c and $\text{ap}(k, C')$ with $C' \notin \mathcal{B}_{k,\textit{true}}$, such that a $C \in \mathcal{B}_{k,\textit{true}}$ with $C \subset C'$ exists. The following simplifications apply:*

1. *Let $P \in \text{ol}(L, C_{k+1})$. If an injective morphism $p : P \hookrightarrow G$ does not exist, $\text{nex}(P, C')$, $\text{rep}(P, C')$, $\text{del}(P, C')$ and $\text{ex}(P, C')$ can be replaced by \textit{false}.*

2. *If $(L \setminus K) \cap C_{k+1} = \emptyset$, every $\text{del}(P, C')$ can be replaced by \textit{false}.*

3. *If $(R \setminus K) \cap C' = \emptyset$, every $\text{rep}(P, C')$ can be replaced by \textit{false}.*

4. *If 1. and 2. apply, $\text{ap}(k, C')$ can be replaced by \textit{false}.*

5. *If $(R \setminus K) \cap C_{k+1} = \emptyset$, every $\text{rem}(P, C')$ can be replaced by \textit{true}.*

Proof. $\hfill\square$

3.1 potentially minimal improving rules

Definition 3.7 (**potentially minimal improving rule**)**.** *Let a constraint c, and a plain rule $r = L \overset{l}{\hookleftarrow} K \overset{r}{\hookrightarrow} R$ be given. Let E be the set of all existentially bound graphs and U be the set of all universally bound graphs C_j of c with $j \leq k$. The rule r is called potentially minimal improving at layer k with $C_k \subseteq C \subseteq C_{k+1}$, if*

$$(L \setminus K) \cap \bigcup_{C_j \in E} C_j \setminus C_{j-1} = \emptyset$$

and

$$(R \setminus K) \cap \bigcup_{C_j \in U} C_j \setminus C_{j-1} = \emptyset$$

and either 1 or 2 applies.

1.
$$L \subseteq C_k$$

with $(L \setminus K) \cap (C_k \setminus C_{k-1}) \neq \emptyset$

2.
$$C' \subseteq R$$

with $(R \setminus K) \cap (C_{k+1} \setminus C') \neq \emptyset$ and $C_{k-1} \subseteq C \subseteq C' \subseteq C_k$. *If 1 applies, r is called a deleting potentially improving rule. If 2 applies, r is called an inserting potentially improving rule.*

Definition 3.8 (appl. conditions for potentially minimal improving rules). *Let a constraint c in EANF and a potentially minimal improving rule $r = L \xleftarrow{l} K \xrightarrow{r} R$ at layer k with C be given.*

$$\mathrm{ap}(j, C) := \begin{cases} \exists \big(L \hookrightarrow C_k, \neg\exists(C_k \hookrightarrow C, \mathsf{true}) \big) & , \text{ if } j = k \\ \mathsf{false} & , \text{ if } j \neq k \end{cases}$$

Lemma 3.9. *Let a graph G, a constraint c with $G \models \mathrm{part}(k, c, C')$ and $G \not\models_j c$ for all $j > k$ and a potentially minimal improving rule $r = L \xleftarrow{l} K \xrightarrow{r} R$ at layer k with C' be given. Then, every*

Lemma 3.10. *Let a constraint c and a potentially minimal improving rule $r = L \xleftarrow{l} K \xrightarrow{r} R$ at layer k with C be given. The, the rule $r' = (r, \mathrm{ap}(k, C))$ is a direct minimal consistency improving rule.*

Proof. Let G be a graph with $G \models_k c$ and $G \not\models_j c$ for all $j > k$ and let $G \Rightarrow_{r',m} H$ be a transformation. Since r is a potentially improving rule, r cannot destroy any occurrences of existentially bound graphs C_j with $j \leq k+1$ and cannot create any new occurrences of universally bound graphs C_j with $j \leq k$. Hence, $H \models_k c$ and equation (2.1) is satisfied. Since $G \models_k c$ and $\mathrm{ap}(k, C)$ has been evaluated to true, equation (2.3) is also satisfied. □

Definition 3.11 (repairing rule set). *Let a constraint c in EANF and a set of rules $\mathcal{R}$ be given. Then, $\mathcal{R}$ is called a repairing rule set if for all graphs G a sequence*

$$G = G_0 \Rightarrow_{r_0} \ldots \Rightarrow_{r_{n-1}} G_n = H$$

exists, such that $r_j \in \mathcal{R}$ for all $j \in \{0, \ldots, n-1\}$ and $H \models c$.

Lemma 3.12. *Let a constraint c in EANF w and a set of rules $\mathcal{R}$ be given. Then $\mathcal{R}$ is a repairing set for c if either 1. applies for every layer of c or 2. applies.*

1. *Let C_j be a existentially bound graph of c. A set of graphs*

$$C_{k-1} \subset C'_0 \subset \ldots \subset C'_n = C_k$$

exists, such that $\mathcal{R}$ contains a inserting potentially minimal improving rule at layer j with C_ℓ with $\ell = 0, \ldots n$.

2. *For one universally bound graph C_j of c, $\mathcal{R}$ contains a deleting potentially minimal improving rule and for every existentially bound graph C_ℓ with $\ell < k$ 1 applies.*
